

## ASSUME:

We discover a new particle and we name it 'Afteru'.

We find that the natural motion of the Afteru particle can be expressed by the following relation,

in which  $u$  represents position, measured in cm, and  $t$  represents time, measured in sec:

$$\frac{\partial^2 u}{\partial t^2} = -nu$$

$$n = \frac{\pi^2}{64} \frac{\text{rad}^2}{\text{sec}^2}$$

$$\text{when } t = 0,$$

$$u \equiv u_0 = 300 \text{ cm}$$

1) Find, derive or write down a solution to the above dif. eq. for  $u$ :

That is, write down a relation by which we can obtain numerical values for  $u$  as a function of  $t$ .

2) Use the solution you obtained above:

In cm, determine the value of  $u$  for the following:

a)  $t = 0 \text{ sec}$

b)  $t = 1 \text{ sec}$

c)  $t = 2 \text{ sec}$

d)  $t = 4 \text{ sec}$

e)  $t = 8 \text{ sec}$

f)  $t = 16 \text{ sec}$

g)  $t = 32 \text{ sec}$

3) In seconds, determine  $T$ : the period of time for one full cycle of  $u$  values.

4) Assume that  $\varphi$  is constant, measured in radians.

Is  $u = u_0 \cos(\omega t + \varphi)$  a solution to  $\frac{\partial^2 u}{\partial t^2} = -nu$ ?

Prove your answer.

5) In meters, determine  $u$  for the following:

i)  $\varphi = 0$ :

a)  $t = 0 \text{ sec}$

b)  $t = 1 \text{ sec}$

c)  $t = 2 \text{ sec}$

d)  $t = 4 \text{ sec}$

e)  $t = 8 \text{ sec}$

f)  $t = 16 \text{ sec}$

ii)  $\varphi = \frac{\pi}{4}$ :

a)  $t = 0 \text{ sec}$

b)  $t = 1 \text{ sec}$

c)  $t = 2 \text{ sec}$

d)  $t = 4 \text{ sec}$

e)  $t = 8 \text{ sec}$

f)  $t = 16 \text{ sec}$

iii)  $\varphi = \frac{\pi}{8}$ :

a)  $t = 0 \text{ sec}$

b)  $t = 1 \text{ sec}$

c)  $t = 2 \text{ sec}$

d)  $t = 4 \text{ sec}$

e)  $t = 8 \text{ sec}$

f)  $t = 16 \text{ sec}$

iv)  $\varphi = \frac{\pi}{2}$ :

a)  $t = 0 \text{ sec}$

b)  $t = 1 \text{ sec}$

c)  $t = 2 \text{ sec}$

d)  $t = 4 \text{ sec}$

e)  $t = 8 \text{ sec}$

f)  $t = 16 \text{ sec}$

Now Assume:

Further research reveals an enormous horizontal line of identical Afteru particles: We call this line the 'x - axis'.

Each particle remains at its own particular coordinate on this x - axis, but seems to move in some kind of pattern along a perpendicular 'y - axis'.

6) Determine  $u$  for each of the following:

i)  $\varphi = \frac{\pi x}{4}, t = 0 \text{ sec}$

a)  $x = 0 \text{ cm}$

b)  $x = 1 \text{ cm}$

c)  $x = 2 \text{ cm}$

d)  $x = 4 \text{ cm}$

e)  $x = 8 \text{ cm}$

f)  $x = 16 \text{ cm}$

ii)  $\varphi = \frac{\pi x}{4}, t = \text{sec}$

a)  $x = 0 \text{ cm}$

b)  $x = 1 \text{ cm}$

c)  $x = 2 \text{ cm}$

d)  $x = 4 \text{ cm}$

e)  $x = 8 \text{ cm}$

f)  $x = 16 \text{ cm}$
